Presented are coefficients (univariate model) and "importance ~ + bx + bx" (adjusted model). (Not shown: Log-linear models were fitted to log-transformed ratings with similar results which are provided on request.)

Legend:
- P-values indicate reference levels for male, language region > German, practice location > urban, practice type = primary, or an age increase to 10 years, respectively.
- Values indicate (familial) significance with thresholds of α = 0.05 (yellow) and α = 0.01 (red) (*α < 0.05) (1/T: *p < 0.0004).
